Master Thesis (24 CP)	53

1st. Semester

Coastal and Estuarine Management
Küsten- und Ästuaringenieurwesen

Mode of Examination VbP (PF 100%) / -	Art/SWH 2V / 2Ü	Language E	CP 6	Semester WS
---	---------------------------	----------------------	----------------	-----------------------

Learning Objectives

Students acquire principles of near-shore coastal processes and anticipated changes in coastal zones due to multiple drivers and stressors. Students are competent in applying basic assessment approaches and design tools for coastal management purposes regarding the dynamic, continuous and iterative processes designated to promote sustainable management of coastal zones. On basis of this knowledge, students are capable to address and solve problems regarding coastal hazards, risks, vulnerability assessments and are acquainted with the fundamentals of policies and administration processes.

Contents

- Drivers and stressors of near-shore processes and changes in coastal zones
- Basic assessment approaches and design tools for coastal management, economics and ecology of coastal zones
- Stakeholders, coastal environment and measures to protect/defend/sustain the coastlines
- General design and maintenance of infrastructures and "low-regret" measures

Workload	180 h (60 h in-class teaching and 120 h self-study incl. course achievements and examination performances)
Recommended Prior Knowledge	Environmental Hydraulics

Environmental Hydraulics
Umwelthydraulik

Mode of Examination	Art/SWH	Language	CP	Semester
K	2V / 2Ü	E	6	WS

Learning Objectives

This module introduces the general principles needed to describe and model surface and subsurface flows. Elementary theories such as the conservation of mass, energy and flux as well as quantities to describe flow properties are described. The module also gives an insight into the concepts of physical and numerical modeling. Furthermore, knowledge about hydraulic structures and their main purposes are presented. Upon successful completion of this module the students are able

- to understand the physical processes and phenomena that are relevant for surface and subsurface flow;
- to remember the fundamental principles for modeling flow processes and implementing them for practical problems;
- to apply simple hydro-numerical solution schemes.

Contents

1. Groundwater Hydraulics:

- Continuum description of porous media
- Darcy's law
- Continuum equation for ground water
- Application for different types of aquifers
- Well hydraulics
- Regional ground water flow
- Numerical schemes for groundwater flow

2. River Hydraulics:

- Kinematics and kinetics of flow (balance equations)
- Laminar and turbulent flow
- Flow models, similarity theory, physical modeling
- Potential theory
- Stationary, steady state open channel flow
- Normal discharge, supercritical and subcritical flow
- St. Venant equations, iterative solutions for the water table
- Fundamentals of hydronumerical simulations (floods)

Hydrology and Water Resources Management
Hydrologie und Wasserwirtschaft

Mode of Examination	Art/SWH	Language	CP	Semester
K	2V / 2Ü	E	6	WS

Learning Objectives

This modul introduces the basic understanding of hydrological processes, and the application for planning and designing human activities in the management of water resources. Upon completion of the module, students are able to:

- understand the water balance components precipitation, evapotranspiration and runoff;
- apply different concepts for the calculation of runoff from rainfall;
- apply hydrological methods in water resources and environmental planning;
- design reservoirs and other structures e.g. for irrigation;
- evaluate options for the spatial and temporal redistribution of water resources including the technical feasibility and economic consequences;
- analyse the risk of extreme events in hydrology and water resources management.

Contents

1. Hydrology I:

- Cycle of water, energy and matter, catchment
- Precipitation: genesis, measurement, calculation
- Evaporation: types, measurement, calculation
- Stage and discharge: measurement, analysis
- Floods and droughts
- Subsurface water: soil water, groundwater
- Rainfall runoff relationships: runoff generation, runoff transformation, flood routing

2. Water Resources Management I:

- Reservoir design, retention; Flood risk management
- Irrigation and drainage; Economic project assessment.

Hydropower Engineering
Energiewasserbau

Mode of Examination	Art/SWH	Language	CP	Semester
- / K (50%) + K (50%)	2V / 2Ü	E	6	WS

Learning Objectives

In this course the students acquire extended knowledge about weir and dam construction as well as subsoil sealing. The students achieve general competences in planning, designing and dimensioning of hydro dams and their foundations. Furthermore, they obtain basic knowledge about economical energy aspects, hydropower station components, - design and utilisation as well as usage of hydro power in coastal areas.

After the successful participation in this course the students are able to

- develop basic construction plans for the construction of water supply and power structures;
- carry out basic stability checks on the respective buildings;
- design the above mentioned buildings for stability against erosion and permeability by application of filter laws;
- basic knowledge of designing the respective structures for the purpose of energy generation.

Contents

- design guidelines, principles of construction and dimensioning concepts for barrages
- different construction types and operation modes of hydropower plants
- river power plants and storage power plants
- design of turbines
- hydraulic design of flood spillways
- dam structures, operation and verification of stability
- FE-analyses of dams
- construction of earth
- fill dams and subsoil sealing

Workload	180 h (60 h in-class teaching and 120 h self-study incl. course achievements and examination performances)

Hydrochemistry and -biology
Hydrochemie und -biologie

Mode of Examination K	Art/SWH 2V / 2Ü	Language E	CP 3	Semester WS
---------------------------------	---------------------------	----------------------	----------------	-----------------------

Learning Objectives

The engineering students will gain competences about to describe and analyse basic chemical and biological processes occurring in the natural and the engineered environment.

After successful completion of this module, students will be able to:

- identify acid-base, redox, and precipitation reactions,
- describe the kinetics of chemical reactions,
- describe microbial kinetics and stoichiometry,
- examine the processes of carbon and nutrients removal in wastewater treatment

Contents

- Stoichiometry of acid-base, redox, and precipitation reactions,
- Kinetics of chemical reactions; Basic aspects of the growth of microorganisms,
- Kinetic description of microbial growth; Basic energetics of microbial growth,
- Wastewater characterization; Biological aerobic/anaerobic processes in wastewater treatment

Research Planning & Scientific Communication
Forschungsplanung und wissenschaftliche Kommunikation

Mode of Examination VbP (PR 40% + SE 60%) / -	Art/SWH 2S	Language E	CP 3	Semester WS
---	----------------------	----------------------	----------------	-----------------------

Learning Objectives

At the end of this course, students will be able to research, write about, and present scientific information. Students will conduct a literature review on a selected water resources or environmental management topic. In this course, students will learn to:

- search for literature, efficiently and critically read scientific literature;
- identify and avoid common mistakes made by English as a second language (ESL) speakers,
- research and write about a water resources or environmental problem,
- write about a scientific topic in a clear and concise manner,
- structure scientific documents (understand what goes where),
- be able to create effective tables and figures,
- learn how work well in a team,
- learn basics about organizing research from proposal to lab to results presentation.

Contents

- Carry out scientific and project related literature search
- Learn to work with the search systems Scopus and Google Scholar
- Understand the goals of scientific writing
- Scientific standards including awareness of plagiarism
- Specifics of scientific writing: structure, style, figures, equations, referencing
- Students write a short article intelligible to all interested readers, and a literature review about a specific topic

Workload	90 h (30 h in-class teaching, partially online, and 60 h self-study incl. course achievements and examination performances)
Recommended Prior Knowledge	-

Research Methodology: A Step-by-step Guide for Beginners. London, U.K.: Sage Publications.
Media	Whiteboard, Powerpoint-Presentation, Videos, Stud-IP, Computer
Particularities	As intermediate exam, students elaborate a short and generally understandable article about a water related problem of their country of origin and present this in class or online (PR, counting 40 % of the grade). The second part of the exam is a short scientific literature review (6-8 pages) about a topic from their major of study, to be conducted in the last third of the semester (SE, counting 60 % of the grade).

Soil Mechanics for Hydraulic Structures

Bodenmechanik für den Wasserbau

Mode of Examination MP/ -	Art/SWH 1V / 1Ü	Language E	CP 3	Semester WS
-------------------------------------	---------------------------	----------------------	----------------	-----------------------

Learning Objectives

I. Hydraulic structures:

Students know fundamentals about the construction and design of dams and barrages and about the possibilities to gain waterpower.

II. Soil Mechanics:

Students know the fundamentals of soil types and soil behaviour and can apply them for the determination of settlements and bearing capacity of foundations

Contents

I. Hydraulic structures:

- Construction and design of dams and barrages
- Waterpower Engineering

I. Soil Mechanics:

- Soil types and soil features
- Methods of field and laboratory investigations
- Shear strength, compressibility and permeability of soils
- Design of foundations

Statistical Methods
Statistische Methoden

Mode of Examination VbP (P 25%) / K (75%)	Art/SWH 2V / 2Ü	Language E	CP 6	Semester WS
---	---------------------------	----------------------	----------------	-----------------------

Learning Objectives

The modul teaches basic concepts and methods of statistics concerning environmental data analysis including knowledge for management and analyses of emperical data within the free statistical software R. The overall focus is on environmental data, which are relevant to hydrology and water resources management.

Upon completion of the module, students are able to:

- select suitable methods for data analyses,
- apply basic statistical methods and interpret results correctly,
- apply the statistical software R for basic data analyses and graphical representation.

Contents

1. Statistics:

- plausibility, consistence and homogeneity of data
- descriptive statistics, probability, distribution functions
- extreme value analysis, risk assessment, floods
- tests, correlation, regression
- time series analysis and synthesis

2. Statistical Software R:

- General introduction to R
- Data management and statistical calculations with R
- Interpretation of the results

2nd. Semester

Meteorology and Climatology
Meteorology and Climatology

Mode of Examination: - / K	Art/SWH 2V	Language E	CP 3	Semester SS	Exam. Number ?
Course achievements: - (-)					

Learning Objectives

The objective of this course is to impart fundamental knowledge about weather, climate and atmospheric phenomena. After successful completion of the module, students will have the ability to describe the atmosphere's composition and characteristics, to distinguish between different weather variabilities, and to solve problems regarding the atmospheric variables and processes, either analytically or with numerical methods. This also includes a brief review on instruments used in atmospheric sciences.

Contents

- Introduction to weather, climate and the atmosphere
- Basic physical laws of the atmosphere and basic quantities (temperature, pressure, wind, and humidity)
- Atmospheric processes and their interaction: e.g., radiation, thermodynamics including adiabatic processes, general circulation, formation of precipitation
- Instruments to measure meteorological quantities
- Climate and climate change

Field Measuring Techniques in Coastal Engineering
Naturmessungen im Küsteningenieurwesen

Mode of Examination	Art/SWH	Language	CP	Semester
K / ungraded Term Paper	2V / 2Ü	E	6	SS

Learning Objectives

The module imparts knowledge about the basics, capabilities and the field of application of different measuring techniques used in coastal engineering. Modern techniques and devices are part of the module in order to capture, process and analyze hydro- and morphodynamic parameters. After the successful participation in this course the students are able to:

- Apply statistics and signal processing to measured data
- Analyze sea-state data and assess characteristic parameters
- Understand the set-up and infrastructure of survey vessels
- Plan the use of unmanned aerial and underwater vehicles (ROVs, AUVs, UAVs)
- Apply different techniques for measuring currents
- Understand the basics of modern echo-sounders (multibeam echo-sounder, sub-bottom profiler)
- Assess the characteristics of coastal sediments
- Apply different techniques of sediment sampling
- Measure and analyse water quality parameters (CTD, pH, dissolved oxygen)
- Design stationary equipment carrier systems (poles, buoys, landers)
- Plan field surveys and assess involved risks
- Present relevant results / write scientific reports

Contents

- Lectures regarding above-mentioned topics accompanied by exercises
- Practical examples based on the scientific work of the Ludwig-Franzius-Institute and the Coastal Engineering Group, University of Queensland (UQ)
- Practical training in the field / in the laboratory
- Exchange and video tutorials with students of UQ

Workload	180 h (60 h in-class teaching and 120 h self-study incl. course achievements and examination performances)

Flow & Transport Processes
Strömungs- und Transportprozesse

Mode of Examination	Art/SWH	Language	CP	Semester
K / -	2V / 2Ü	E	6	SS

Learning Objectives

In this module, the students learn about the physical processes and phenomena that are relevant for water flow, contaminant transport, and heat transfer. Equations that describe groundwater flow, contaminant transport and heat transfer will be developed. Numerical and analytical solutions of these equations are presented and discussed.

After successful participation of this module, the students can

- explain the physical processes describing groundwater flow, contaminant transport and heat transfer,
- derive equations governing groundwater flow, contaminant transport and heat transfer,
- quantify fluxes of groundwater mass, contaminant mass and heat,
- solve the governing differential equations both analytically and numerically,
- implement the most important physical processes in a numerical model,
- design and run a numerical (2D oder 3D) model describing transient groundwater flow, contaminant transport and heat transfer,
- visualize and analyze simulation results,
- apply the models to relevant problems in environmental engineering.

Contents

- Fully mixed systems
- Balance equations
- Derivation of the transient groundwater flow equation
- Scenarios of groundwater extraction by pumping
- Analytical and numerical solutions of the groundwater flow equation,
- Advection, dispersion, molecular diffusion, adsorption, radioactive decay
- Derivation of the complete contaminant transport equation
- Convection, heat dispersion, conduction
- Derivation of the complete heat transfer equation
- Initial and boundary conditions
- Flow and transport in fractured rock
- Coupling of flow and transport: variable-density flow

Workload	180 h (60 h in-class teaching and 120 h self-study incl. course achievements and examination performances)
Recommended Prior Knowledge	Environmental Hydraulics

Hydrological Extremes
Hydrologische Extreme

Mode of Examination VbP (25%) / K (75%)	Art/SWH 2V / 2Ü	Language E	CP 6	Semester SS
---	---------------------------	----------------------	----------------	-----------------------

Learning Objectives

First, the students learn advanced methods about the estimation of water balance components, description of rain-fall-runoff processes and climate change analyses. Then, they get to know how to deal with the two hydrological extremes floods and droughts. Finally, techniques for the application of hydrological models are introduced and the students apply a model for flood simulation themselves in computer lab work. Upon completion of the module, students are able to

- understand processes of rainfall runoff transformation;
- compute design values for floods and low flow;
- apply models for flood prediction.

Contents

1. Hydrological extremes: Water balance components; Rainfall-runoff transformation; Floods and droughts; Forecasting; Climate change
2. Hydrological modelling: theory of hydrological modelling; parameter estimation, calibration, validation; data preprocessing, flood simulation

Maritime and Port Engineering
See- und Hafengebäude

Mode of Examination	Art/SWH	Language	CP	Semester
K / ungraded Presentation	2V / 2Ü	E	6	SS

Learning Objectives

The module imparts knowledge about the planning, management and maintenance of ports and harbours. Furthermore, external speakers share their practical experiences in the field of Maritime and Port Engineering.

After the successful participation in this course the students are able to:

- Assess the role and development of maritime navigation and logistical concepts
- Plan and classify harbour structures
- Understand the management and maintenance of ports and port infrastructure
- Recognize/estimate hydraulic processes within ports and their interactions with vessels
- Estimate the importance of economical and ecological aspects for ports
- Classify different dredging technologies
- Understand, describe and assess relevant scientific literature

Contents

- Planning, layout and logistics of ports and harbours
- Economical aspects of Maritime and Port Engineering
- Infrastructure and management of ports and harbours
- Ecological aspects in regard of maintenance and operation
- Cross-shore and lateral sediment transport
- Design and maintenance of breakwaters and piers, seawalls and jetties
- Dredging technologies
- Small harbours and sport boat marinas
- Practical examples of Maritime and Port Engineering

Workload	180 h (60 h in-class teaching and 120 h self-study incl. course achievements and examination performances)
Recommended Prior Knowledge	Wasserbau und Küsteningenieurwesen (D)
Literature	BRUUN, P., Port Engineering. Research Project
Forschungsprojekt

Mode of Examination - / ST (80%) with KO (20%) KO (20 %)	Art/SWH -	Language E	CP 6	Semester WS/SS
---	---------------------	----------------------	----------------	--------------------------

Learning Objectives

Students know how to plan and conduct research activities. They perform scientific literature research and they practise the structuring and writing of scientific texts. They present their results within a group of peers and supervisors. Upon completion of the module, students are able to:

- read and discuss advanced scientific research papers;
- write large scientific student documents;
- present a topic within a given time frame.

Contents

- Structuring and managing research projects
- Practise of writing a scientific thesis, including the presentation of scientific results (experimental and theoretical work)
- Writing of a student thesis based on data or scientific papers (approx. 15 to 20 pages)
- Presentation and discussion of the findings

Workload	180 h (0 h in-class teaching and 180 h self-study incl. course achievements and examination performances)
Recommended Prior Knowledge	Research Planning and Scientific Communication, basic modules within the field of the topic of the research project
Literature	-
Media	Individual supervision, student work
Particularities	The research project thesis has to be submitted within six months after assignment. The full results of the work including a pdf file of the final thesis have to be submitted electronically. Two hardcopy versions of the work have to be submitted. The student has to present the final results within a colloquium. This contains a presentation of the research project results plus discussion.

Solid Waste Management
Abfallwirtschaft

Mode of Examination	Art/SWH	Language	CP	Semester
- / K	2V / 2Ü	E	6	SS

Learning Objectives

The course imparts advanced knowledge on how to manage and treat “waste” with regard to sustainability and circular economy. At the beginning, definition of waste, general conditions as well as specific waste amounts will be briefly introduced. Solid Waste Management (SWM) steps such as collection, transportation, sorting, treatment, recycling and disposal is the next focus of this course. Moreover, the concepts and techniques for mechanical and biological treatment (composting, digestion, stabilization), their combination (MBT, MBSt) and techniques for thermal treatment (wte, combustion, gasification, etc.) are presented.

The next main thema of this course is the concepts and techniques for avoiding, up- or re-cycling, re-use and disposal of the waste treatment output according to EU’s waste hierarchy. Process descriptions, design data and conditions as well as output qualities are discssed according to legal criteria for disposal, emission or environmental protection. Furthermore, principles and requirements of landfill construction, their control and emissions as well as the handling of abandoned polluted areas are briefly introduced. The lecture focuses on contemporary practical examples, and the theoretical knowledge will be consolidated in tutorials in form of calculation examples. After successful completion of this module, students are capable of:

- elucidating SWM techniques and recycling processes,
- developing treatment concepts for different kinds of waste and recycling materials,
- estimating treatment options for polluted areas,
- designing an organic waste treatment plant (composting, anaerobic digestion),
- conceptualizing a landfill considering leachate and gas production,
- discussing SWM issues within the legal framework of climate change and environment protection.

Contents

- Definition of waste and Introduction of related legislations
- Collection, transportation and specific treatment of waste
- Biological, mechanical-biological and thermal waste treatment incl. emission control
- Construction, handling and management of landfills and abandoned polluted areas incl. treatment of their emissions (leachate and landfill gas)
- Recycling of glass, paper, plastics, wood, metal and construction waste
- Evaluation of waste treatment and management concepts

Workload	180 h (60 h in-class teaching and 120 h self-study incl. course achievements and examination performances)
Recommended Prior Knowledge	Siedlungswasserwirtschaft und Abfalltechnik (D)

Urban Hydrology
Stadthydrologie

Mode of Examination	Art/SWH	Language	CP	Semester
VbP (25%) / K (75%)	2 V / 2 Ü	E	3	SS

Learning Objectives

This module provides specific knowledge of the urban hydrological cycle and its characteristics. Emphasis is not only put on process understanding but also on urban storm water management including exercises and application of computer models. In this way, students will learn how urban areas alter the water balance including implications on the quantity and quality of water. Upon completion of the module, students are able to:

- Describe and analyse hydrological processes in urban areas including hydraulics.
- Design different measures in urban storm water management with emphasis on nature-based solutions / green infrastructure (e.g., retention, infiltration, drainage).
- Understand mechanisms of pluvial and fluvial floods in urban areas and measures to cope with flooding.
- Apply urban drainage models (EPA SWMM) in order to study the impact of different measures (e.g. green infrastructure, retention etc.) on drainage in combined and separated collection systems.
- Identify challenges and opportunities of co-designing solutions that also acknowledge other targets (e.g., urban climate, climate change adaptation, waterway restoration) in the light of sustainability and liveable cities.

Contents

1. Introduction to Urban Hydrology
2. Processes I (runoff generation)
3. Processes II (runoff concentration and runoff routing)
4. Drainage in urban areas / drainage collections systems and detention ponds
5. Computer models in Urban Hydrology
6. Sensor systems in Urban Hydrology
7. Introduction to stormwater management / nature-based solutions / green infrastructure
8. Radar and Real Time Control (RTC)
9. Pluvial floods in urban areas
10. Urban hydrology in the light of urbanization and climate change

Water Economics
Wasser und Ökonomie

Mode of Examination K / -	Art/SWH 2V	Language E	CP 5	Semester SS
-------------------------------------	----------------------	----------------------	----------------	-----------------------

Learning Objectives

The course enables students to understand and discuss theoretical basics, practical problems and recent developments in water economics and policy

Contents

In detail, the course addresses water scarcity in the global food production and discusses water in environmental context. Students also learn about water valuation, including market (supply and demand), tariff structures, project assessment and payment for ecosystem services. Furthermore, water policy finds consideration, related to general governance (control and regulation systems; integrated water resource management), the Sustainable Development Goal 6 (clean water and sanitation), oceans, privatization and simulation models. Finally, students focus on game theory and river-sharing and learn about water trends and conflicts. Case study applications complement the course, for example from aquaculture. Participation in the related exercise on water economics is recommended.

Workload	180 h (60 h in-class teaching and 120 h self-study incl. course achievements and examination performances)
Recommended Prior Knowledge	Basic understanding of economics will be an advantage for participants.
Literature	Selected journal articles will be provided during the lecture.
Media	PowerPoint, Black-Board
Particularities	The course is in English. Exam students choose between English or German.

Wetland Ecology and Management with Excursion
 Ökologie und Bewirtschaftung von Feuchtländern

Mode of Examination	Art/SWH	Language	CP	Semester
VbP / -	3V / 1Ü	E	6	SS

Learning Objectives

In this module, students acquire detailed knowledge about different wetlands types and the ecology of natural wetlands. Furthermore, the module introduces management issues, such as wetland restoration, treatment wetlands, and wetland protection. After successfully completing this course, students will be able to

- identify and describe the ecological services provided by wetlands;
- design a plan for studying the hydrology of a wetland;
- understand how plants adapt to deal with different environmental conditions found in wetlands;
- differentiate between the six main wetland types;
- apply water and soil sampling methods in a wetland;
- discuss different environmental protection measures in a wetland;
- identify which treatment wetland is best used in which situation;
- create restoration plans for a degraded wetland.

Contents

- introduction to wetlands: definition and importance
- wetland Environment: Hydrology, Biogeochemistry, Biological adaptations (plants and animals)
- wetland Ecosystems: Coastal wetlands, Freshwater marshes and swamps, Peatlands
- wetland management: Restoration, Types of treatment wetlands, Threats and degradation of wetlands
- wadden Sea ecology and management incl. Field training

Industrial Water Supply and Water Management
 Industrielle Wasserversorgung und Wasserwirtschaft

Mode of Examination	Art/SWH	Language	CP	Semester
K	2V / 2Ü	E	6	SS

Learning Objectives

This course introduces the basic principles and concrete technological aspects of industrial water management. The main objective of this course is to give the students a deep insight into management and treatment of boiler- and cooling water, principles of watercycles in industry in the context of Production-Integrated Environmental Protection as well as the main technologies for industrial water- and wastewater treatment including physical, chemical and biological methods. The technologies and approaches presented are substantiated with calculation examples during the tutorials. Students acquire the skills to design and calculate the mentioned technological processes. In addition, they get a comprehensive overview about the production-integrated environmental protection measures in different industries.

After successful completion of this module, students are capable of:

- explaining the boiler and cooling water processes, water quality requirements of different industries and production,
- assessing the possibilities for implementation of process-integrated environmental protection measures,
- explaining relevant water treatment processes in detail and, furthermore, designing these processes and interpreting them in the context of the special circumstances in industrial production,
- developing application possibilities for end-of-pipe solution for industrial wastewater treatment including relevant special treatment approaches (e.g. UASB reactors),
- evaluating technological solutions across media, comparing alternatives and benchmarking between process-integrated and end-of-pipe solutions

Contents

1) Industrial water supply and treatment:

- Relevant Regulatory Framework – IED, Cross-Media and Best Available Techniques Approaches(BAT)
- Hot water supply for power generation plants and cooling-water cycles
- Treatment approaches for industrial fresh water (softening, desalination, deacidification)
- Introduction and design of concrete treatment technologies such as Gas Exchange, Ion-Exchange, Chemical Precipitation, Membran Filtration, AC-Adsorption and many more

2) Industrial wastewater treatment:

- Types and composition of industrial effluents
- Examples for process-intergrated environmental protection measures
- Approaches for the treatment of industrial process waters and wastewaters
- Concrete design of the individual wastewater treatment steps
- Concepts for holistic industrial water and energy management in specific industries

Modelling in Sanitary Engineering
Modellierung in der Siedlungswasserwirtschaft

Mode of Examination	Art/SWH	Language	CP	Semester
VbP / -	2V / 2Ü	E	6	SS & WS

Learning Objectives

Simulation of processes has become a crucial tool for engineers for solving tasks such as design of plants, operation control, process optimization and for evaluation and development of systems (catchment area, circular economy, etc.).

This course aims to introduce the students into the modelling basics of wastewater treatment plants.

Within the scope of this course students will have to develop a strategy for a typical engineering task using the simulation software SIMBA classroom as a tool.

The required theoretical knowledge about commonly used activated sludge models (ASM), design of wastewater treatment plants, typical control strategies and about the simulation tool SIMBA classroom will be provided by the lectures and exercises.

After completing this course, students will have the competence to:

- assess the performance and identify the limitations of different models,
- create relevant computer-aided technical models for specific systems,
- understand biological processes and kinetic parameters of ASM 1-3 and ADM and apply them in the simulation software (SIMBA classroom),
- evaluate critically results of a simulation
- identify problems in the operation of a wastewater treatment plant and propose solutions.

Contents

- Biological processes in wastewater treatment (carbon, nitrogen and phosphorus removal) - Mathematical basics of different activated sludge models
- Transport processes in different reactors (CSTR, PFR, Batch)
- Petersen matrix and its components
- Introduction to the basic steps of the Modelling, such as calibration, validation, sensitivity analysis, parameter identification and fitting, etc.
- Control strategies for sewage treatment plants
- Application of simulation software SIMBA classroom (static and dynamic simulation)
- Simulation of different wastewater treatment plants and interpretation of the simulation results
- Experimental methods to determine parameters required for simulation

Workload	180 h (60 h lessons and 120 h self-study including examination / study performance)
Recommended Prior Knowledge	-
Literature	<p>The lecturers makes an up-to-date bibliography available on StudIP for each semester, selection of literature:</p> <p>Henze et al., Wastewater treatment, Biological and Chemical Processes, Springer-Verlag, 1995.</p> <p>Schütze, Modelling, Simulation and Control of Urban Wastewater Systems, Springer, 2002.</p> <p>Makinia, Mathematical Modelling and Computer Simulation of Activated Sludge Systems, IWA Publishing, 2010</p> <p>Makinia, J. 3rd. Semester

Infrastructures for Water Supply and Wastewater Disposal
 Infrastrukturen der Wasserversorgung und Abwasserentsorgung

Mode of Examination	Art/SWH	Language	CP	Semester
K	3V / 1Ü	E (online D)	6	WS (P+F)

Learning Objectives

The course seeks to impart the technological knowledge in layout, dimensioning and construction of buildings and equipment in sanitary engineering like water supply, sewage technology and waste management. Additionally, special topics and advanced technical themes regarding emerging pollutants, resource-efficiency and re-use of rainwater and wastewater are presented and discussed in the context of infrastructure development.

After successful completion of this module, students would have the knowledge to design water supply and wastewater disposal systems and to apply in-depth methods and dimensioning BAT approaches for all mentioned components and processes in the urban water cycle. Furthermore, the students acquire the competence to conceive and evaluate the operation of the water infrastructures and to implement adapted concepts for their maintenance.

Contents

- Identification and determination of relevant planning data, forecasts, uncertainties, risk and safety concepts
- Technical design of drinking water supply system (extraction, treatment, storage and distribution)
- Technical design of wastewater disposal systems (types of urban drainage systems, mechanical, biological and chemical treatment approaches on wwtps, dentrilised versus decentralised structures)
- General rules and strategies for operation of different water infrastructures
- Planning and implementation of innovative or even new urban water infrastructures (Green and Blue Cities)
- Identification of sustainable and maintenance strategies for long-term functionality of the infrastructures incl. concrete technical approaches for inspection, repair and replacement
- Approaches for modelling, also across infrastructures (e.g. how to link urban drainage systems with sewage treatment plants)

GIS and Remote Sensing
GIS und Fernerkundung

Mode of Examination	Art/SWH	Language	CP	Semester
- / K	2V / 2Ü	E	6	WS

Learning Objectives

The modul introduces the underlying principles and methods about Geographical Information Systems (GIS) and Remote Sensing. The overall focus is on environmental data, which are relevant to hydrology and water resources management. In this module the students will obtain an overview over the most important basics and applications of remote sensing. In the end he/she will have understood the central methodologies and will be able to make use of the employed techniques. By independently preparing and then presenting the lab work he/she will further develop his/her learning strategies and presentation skills. Upon completion of the module, students are able to apply geographical information systems for analyses and manipulation of space related data from ground observation and remote sensing

Contents

1. Geographical Information Systems
 - data modelling: geometric, thematic, topologic
 - data analysis and geoprocessing
 - cartography: graphical variables, generalization, presentation
 - data capture, topography: digital elevation models, data interpolation, geomorphology
 - visualization, presentation and analysis: 2D, 3D, terrain
2. Remote Sensing
 - basics: electromagnetic spectrum, interaction of electromagnetic waves and materials, limits of resolution, digital images
 - sensors: multi-spectral satellite sensors, hyper-spectral sensors, airborne laser scanning, synthetic aperture radar
 - processing: generation of thematic maps: classification of land cover using pattern recognition methods, determination of digital height models, in particular from laser scanner and radar data

Workload	180 h (60 h in-class teaching and 120 h self-study incl. course achievements and examination performances)

Recycling and Circular Economy
Recycling und Kreislaufwirtschaft

Mode of Examination	Art/SWH	Language	CP	Semester
VbP (P 40%) / K (60%)	2V / 2Ü	E	6	WS

Learning Objectives

The trigger for global reflection on resource conservation and climate protection was certainly the "Limit to Growth" study presented by the Club of Rome in 1972, which predicted the global impact of industrialisation, population growth, malnutrition, the exploitation of raw material reserves and the destruction of habitats by computer simulation. The result was also that the current individual local action has all global effects, which, however, do not correspond to the time horizon and action space of the individual. In the meantime, these theoretical results have been more than confirmed and have been accelerated by globalization. Keywords such as climate change, energy turnaround and environmental migration are no longer just empty words but measurable global events.

The aim of the module is therefore to convey the global and local connections of resource use, material and energy cycle management and the associated influence on the environment and climate. The students will gain in-depth knowledge of how material cycles are closed, how by-products are recycled and how waste is avoided. Methods are presented (e.g. material flow analysis, life cycle assessment) which enable a holistic, life cycle-oriented assessment of material efficiency under different target parameters (ecological, economic, social) in the industrial value stream.

After successful completion of the module, the students will have the ability to

- recognize the sustainability challenges of the current generation and to create system-based approaches for the creation of a sustainable solution for society,
- use the methodology of material flow analysis for a targeted material or energy flow management (STAN2)
- apply the methodology of Life cycle assessment (LCA) (umberto nxt®)- for the assessment of process chains, products, services and energy systems,
- assess the ecological and economic relevance of the use of materials in technical products and services, and
- develop synergetic approaches of industrial as well as municipal (regional) supply and disposal systems.

Contents

- Impact of global resource use and industrialization (Sustainable Development Goals SDG)
- Recycling management concept and its application in the context of sustainability strategies for organisations, communities and consumers (regional material balance)
- Field of tension of durable products
- Consumer behaviour
- Conservation of resources
- cradle to cradle"
- a.o. approach in the building industry (Buildings as Material Banks)
- Applications according to the European Industrial Emissions Directive IED and Best Available Technologies
- Applications in accordance with the European packaging and recycling strategy
- Recycling of by-products as well as glass, metal, plastics, paper and organic residues
- Instruction and exercises with the LCA software umberto nxt® incl. the ecoinvent database
- Instruction and exercises with the software STAN2 for material and energy flow analysis

Workload	180 h (60 h in-class teaching and 120 h self-study incl. course achievements and examination performances)
Recommended Prior Knowledge	Abfalltechnik / Solid Waste Management
Literature	The lecturers make an up-to-date bibliography available on StudIP for each semester.
Media	StudIP, ILIAS, Blackboard, PowerPoint-Presentation, software

Particularities	none
------------------------	------

Organizer	Weichgrebe, Dirk
Lecturer	Weichgrebe, Dirk
Supervisor	Shafi zadeh, Shima; Zahedi Nezhad, Sara; Dörrié, Beatriz; Nair, Rahul; Hadler, Greta; Illi, Lukas
Examiner	Weichgrebe, Dirk
Institute	Institute of Sanitary Engineering and Waste Management, http://www.isah.uni-hannover.de/ Faculty of Civil Engineering and Geodetic Science

Programme Specific Information	P (mandatory) / W (elective) depending on Major	
	Major A: Water Resources Management	Major B: Sanitary Engineering
	W	W

Special Topics in Sanitary Engineering
Spezielle Aspekte der Siedlungswasserwirtschaft

Mode of Examination	Art/SWH	Language	CP	Semester
K/ -	1V / 1Ü	E	3	WS

Learning Objectives

The focus of this course is on practical aspects and approaches for designing water supply systems, wastewater and sludge treatment plants. Furthermore, economical efficiency calculation for planning and investment decisions in the urban water management is going to be discussed in detail. After successful completion of this module, students are able to

- Make the necessary estimations for wastewater projects;
- Name diverse design parameters of wastewater treatment facilities;
- Design different components of wastewater treatment plants;
- Interpret the causes of operational problems at wastewater treatment plants;
- Differentiate cost types and perform a cost analysis;
- Execute mathematical processing of costs (cost-leveling);
- Compare project costs in different ways;
- Implement sensitivity analysis of critical values.

Contents

- Tutorials for the dimensioning of municipal waterworks
- Process engineering in wastewater treatment
- Design and dimensioning of wastewater treatment plants
- Investment and operating costs; Ascertaining of costs
- Financial, mathematical processing of costs (levelised costs)
- Comparison of costs; Sensitivity analyses and determination of critical value

Workload	90 h (30h in-class and 60h self-study incl. course achievements and exam performances)
Recommended Prior Knowledge	Infrastructures for Water Supply and Wastewater Disposal; Natural Sciences
Literature	The lecturers make an up-to-date bibliography available on StudIP for each semester, selection of literature: IAWQ-NVA, Advanced wastewater treatment, International conference, 1996. Judd, Process science and engineering for water and wastewater treatment, IWA Publishing, 2002. Water Environment Federation, Financing and charges for wastewater systems, McGraw-Hill, 2005. Wilderer et al., Water in China. IWA Publishing, 2003.
Media	Blackboard, PowerPoint-Presentations, StudIP, ILIAS
Particularities	The lecture is held by external lecturers.

Water Resources Systems Analysis
Wasserwirtschaftliche Systemanalyse

Mode of Examination	Art/SWH	Language	CP	Semester
VbP (PR 60%) + VbP (LÜ 40%) / -	1V / 3Ü	E	6	2SS

Learning Objectives

This module provides in-depth and interdisciplinary extended knowledge of the conceptual and quantitative systems analytical treatment of water management issues. Ecological, climatic, socio-economic and environmental policy fundamentals are treated as external boundary conditions of integrated water resources management (IWRM). In a seminar on IWRM, in-depth study of a selected integrated or international water management issue takes place in the form of a role play and an individual term paper with multimedia presentation. Furthermore, the students learn the application of water management simulation as a system-analytical method of decision support. In the simulation exercises, students learn how to create models of water availability and water demand using the WEAP software in the context of IWRM.

After successful completion of the module, students will be able to

- analyze large water management projects, including those in developing countries, in an interdisciplinary manner;
- apply the water management simulation model WEAP.

Contents

1. External social and natural boundary conditions of integrated water resources management: participation, climate change, development cooperation.
2. International water management: transboundary problems, arid and semi-arid regions.
3. Seminar (role plays): selected water management problems from the topics of large dams and transboundary river basin management are discussed interactively by students in a game situation.
4. Seminar (presentations): examples of large water management projects in an international and integrated context plus water policy and ethics issues are presented by student posters with interactive discussion.
5. Water management simulation and decision support with WEAP

Workload	180 h (60h in-class and 120h self-study incl. course achievements and exam performances)
Recommended Prior Knowledge	Basic knowledge about water resources management is required (e.g., from module „Hydrology and Water Resources Management“ or „Grundlagen der Hydrologie und Wasserwirtschaft“). Knowledge about hydrological modelling is recommended (e.g., from module “Hydrological extremes”).
Literature	Loucks, D.P. and van Beek, E. (Editors), 2017. Water Resources Systems Planning and Management. Springer International Publishing (open access). Additional, subject specific literature will be announced in the course.
Media	Role play, Powerpoint files and videos of lectures, computer exercises
Particularities	The participation in the seminar counts as a course credit (ungraded attendance exercise, Studienleistung). This includes active and constructive participation in a role play on a given IWRM problem and attendance of at least two seminar lessons of the poster presentations. The role play can be performed either in English or German language. The module includes two course-related and separately existing examinations (VbP): (a) Multimedia presentation on IWRM, in which a poster is individually prepared and presented as a term paper on a topic assigned from a list. The presentation is a short oral explanation of the poster of about 2 minutes plus discussion in the seminar (PR, 40 h, 60%). b) Laboratory exercise: a water management model is to be created and calibrated in the software WEAP within a given time frame according to the task. The examination takes place in a computer laboratory or with the own PC. A short

	summary and evaluation of the results as well as the model files have to be handed in or uploaded to Stud-IP. (LÜ, 5 h, 40%).

Innovative Bioprocesses for Wastewater/Waste Valorization
Innovative Bioprozesse zur Rückgewinnung von Ressourcen aus Abwasser/Abfall

Mode of Examination VbP (P 100%) / -	Art/SWH 2V / 2S	Language E	CP 6	Semester WS
--	---------------------------	----------------------	----------------	-----------------------

Learning Objectives

Students will be able to:

- List the main organic and inorganic compounds in wastewater and waste streams
- Identify the compounds that can be recovered or transformed in products with an added-value
- Sketch a process diagram for the recovery of compounds/products by physicochemical or biological processes
- Calculate the mass flow of wastewater/waste stream recycled and the mass flow of compound/product recovered
- Propose a production process for the compound/product recovered
- Propose an analytical monitoring plan to ensure constant quality of the compound/product recovered

Contents

- Wastewater –based biorefinery (WWBR)
- Production of polymers via wastewater valorization
- Nitrogen removal and recovery
- Phosphorous removal and recovery
- Wastewater reuse
- Greywater and rainwater reuse

Workload	180 h (60h in-class and 120h self-study incl. course achievements and exam performances)
Recommended Prior Knowledge	Hydrochemistry and –biology or Natural Sciences
Literature	The lecturers make an up-to-date bibliography available on StudIP for each semester, selection of literature: Pepper, I. L., Gerba, C. P. and Gentry, T. J. 2015. Environmental Microbiology, 3rd ed. Amsterdam: Elsevier. Pott, R. et al. 2018. Wastewater Biorefineries: Integrating Water Treatment and Value Recovery. In W. L. Filho and D. Surroop (Eds.), The Nexus: Energy, Environment and Climate Change (pp. 289-304). Switzerland Springer International Publishing AG. Surendra K. C. et al. (2015). Anaerobic Digestion-Based Biorefinery for Bioenergy and Biobased Products. Industrial Biotechnology 11(2), 103-112. Verstraete, W., & Vlaeminck, S. E. (2011). Zero WasteWater: Short-cycling of wastewater resources for sustainable cities of the future. International Journal of Sustainable Development and World Ecology, 18(3), 253–264.
Media	Blackboard, PowerPoint
Particularities	The module is structured in Lectures and a Seminar. In the seminar, the students will work in small teams. Each team will develop a project focused on the valorisation of a wastewater/waste stream. The project has 3 milestones: i) definition of the goal, ii) sketch of the process diagram and iii) estimation of productivity, operation costs and the market value of the product.

4th. Semester

Master Thesis (24 CP)

Masterarbeit (24 LP)

Mode of Examination	Art/SWH	Language	CP	Semester
MA (80%) + VbP (20%)/ -	-	D and E	24	WS/SS (P+F)

Learning Objectives

In the module, techniques and skills of scientific working are expanded. After successful completion of the module, students may apply and further develop, within a specified period, scientific methods for the independent solution of a complex task from the field of water resources management, sanitary engineering, environmental and coastal engineering, or of related fields within the scope of the masters program.

Contents

The master thesis is a scientific paper based on knowledge and skills obtained during the studies and may include experimental investigations, simulations, or dimensioning tasks. The students have learned how to apply knowledge gained, to place it into a new context independently, and to use methods enabling them to work in a scientific manner. The results are documented in writing in the master thesis. The essential results are to be presented in a colloquium.

Workload	720 h (0 h in-class teaching and 720 h self-study incl. course achievements and examination performances)
Mandatory Prior Knowledge	60 CP and passed mandatory courses
Literature	Theuerkauf, J.: Schreiben im Ingenieurstudium. Schöningh 2012. Franck, N.; Sary, J.: Die Technik wissenschaftlichen Arbeitens. UTB Stuttgart, aktuelle Auflage; Friedrich, Ch.: Schriftliche Arbeiten im technisch-naturwissenschaftlichen Studium. Mannheim, Dudenverlag, aktuelle Auflage.
Media	-
Particularities	The master's thesis has to be presented in a colloquium which is open to the faculty. The colloquium consists of a lecture on the topic of the master's thesis.
